Profile

Software Engineer with years of experience delivering production grade web and mobile systems across fintech and marketplace domains. Skilled in Java/Spring Boot, Python, React, React Native, and NextJs with hands-on experience in cloud infrastructure (AWS), RESTful API design, microservice architecture, Docker, and secure payment system implementation, including tokenization, webhook verification, and escrow logic. Experience building AI-powered systems using Python and FastAPI with async endpoints, external API integrations, and responsive handling under concurrent load. Skilled at automating manual engineering workflows with AI tooling and driving team-wide adoption, having increased AI tool usage by 83% through targeted training initiatives. Comfortable working extensively with SQL and Postgres writing and optimizing complex queries for transaction and audit data, with a strong grasp of performance and query design. Strong ownership mindset, proactively identifying improvements and leaving codebases in better shape. Passionate about building inclusive, impactful technology that serves underserved communities and drives measurable outcomes.

Professional Experience

Software Engineer

Interswitch

01/2025 – present

Lagos, Nigeria

- Developed and maintained MyVerveWorld, a cross-platform React Native application connecting users to Verve's payment ecosystem across Africa, integrating secure tokenization APIs, multi-platform card services, and real-time transaction flows.
- Engineered backend services in Java Spring Boot for the Loyalty Engine rewards platform, reward system, and alias service, designing RESTful APIs, managing service-to-service communication within a microservice architecture, and ensuring reliable, high-throughput transaction processing.
- Introduced AI-assisted automation into internal engineering workflows, using LLM-based tooling to accelerate code review, test scaffolding, and documentation generation, reducing time spent on repetitive development tasks across the team.
- Built scalable, modular frontend architecture using React.js, Redux Toolkit, and React Query, improving server state management, caching strategies, and data fetching reliability across the platform.
- Integrated and tested RESTful payment gateway APIs and backend microservices, enabling real-time financial transaction updates via Spin microservice infrastructure.
- Implemented hardware-backed biometric authentication (fingerprint/face ID) with AES-256 encrypted credential storage, RSA key-pair management, and device integrity checks to prevent unauthorized access on rooted/jailbroken devices.
- Designed unit and integration tests with Jest and Vitest, reducing regression issues and improving release confidence by 30%+ across production deployments.

- Managed production deployments and service onboarding via the Verve Admin Portal, coordinating cross-functional releases with backend engineers and QA teams in an Agile environment

Software Engineer

03/2023 - 12/2024

Smart Approaches

- Led frontend engineering for GYWDE, a multi-vendor service marketplace; architected a scalable React and React Query web application with SSR, modular component design, and efficient cache management, improving SEO and reducing load times significantly.
- Designed and implemented a secure end-to-end payment flow with idempotent payment requests, webhook-based backend verification, and escrow payout logic to ensure financial accuracy and prevent duplicate transactions.
- Drove AI adoption across the engineering team by identifying high-friction manual workflows suited for AI-assisted automation and rolling out required training sessions on AI-integrated tooling, increasing team-wide AI adoption by 83%.
- Built and optimized mobile application using React Native and TypeScript, delivering a consistent cross-platform experience across Android and iOS.
- Implemented scalable state management with Pinia (Vue) and Redux Toolkit (React Native) to maintain consistent order, payment, and user state across views and devices.
- Wrote comprehensive tests with Vitest (web) and Jest (mobile) to validate payment lifecycle transitions, business logic, and edge cases, improving maintainability and reliability.
- Collaborated with designers and backend engineers to optimize API contracts, refine checkout UX, and enforce performance standards through lazy loading and component memoization.

Software Engineer

10/2022 - 2023

Techstudio Academy

- **Architected and deployed** scalable full-stack applications by integrating responsive **React.js** frontends with robust **Java/Spring Boot** backends to streamline data flow and user interaction.
- **Refactored legacy codebases** into reusable React functional components, implementing **Semantic HTML** and **ARIA roles** to ensure 100% compliance with **WCAG accessibility** and **SEO** best practices.
- **Engineered centralized design systems** and UI libraries using modern CSS frameworks to maintain strict branding and graphic standards across complex, multi-product interfaces.
- **Optimized frontend performance** and state management by leveraging **React Hooks** and **Context API**, bridging the gap between high-fidelity UI designs and high-performance backend APIs.
- **Collaborated within Agile environments** to bridge the technical gap between design requirements and system architecture, ensuring a seamless user experience across the entire development lifecycle.
-

Side Hustle

- Architected full-stack applications integrating React.js frontends with Java/Spring Boot backends, streamlining data flow and API communication across production environments.
- Refactored legacy codebases into reusable React components with Semantic HTML and ARIA roles, achieving full WCAG accessibility compliance and SEO improvement.
- Built centralized design systems and UI component libraries, maintaining consistent branding across multi-product interfaces.
- Optimized state management using React Hooks and C

Education

Master of Business Administration

Lagos Business School, Pan-Atlantic University

2026 - Present

Lagos, Nigeria

B.Sc Microbiology.

Obafemi Awolowo University.

2014 - 2020

Technical Skills

Portfolio

Portfolio website

FlowAid

Humanitarian cash transfer system that streamlines the distribution of resources to those in need. Built with Java spring boot and React Typescript.

Full-stack platform built with Java Spring Boot and React TypeScript to streamline humanitarian resource distribution. Dockerized and deployed on Render with PostgreSQL; features campaign management, recipient enrollment, bulk disbursement, and real-time dashboard analytics with cache-aware stat updates.

Smart Approaches Learning Platform

I collaborated in building a live responsive website with React and Tailwind CSS while integrating a couple of libraries for a better user experience and calling the required endpoints. You can click on the link to preview the design.

Multi bag Deliveries

React and Tailwind CSS delivery platform with user registration, booking management, address handling, package classification, and secure payment checkout flows
